WASHING MACHINE FILTERS REDUCE MICROFIBER EMISSIONS TO ECOSYSTEMS

BACKGROUND

Microfibers, anthropogenic fibers (< 5mm), are the most prevalent type of microplastic and other anthropogenic particle in the environment. Plastic, cotton, and other microfibers from textiles contaminate surface water¹, deep sea², freshwater and marine sediment³, wildlife⁴(including seafood⁵⁻⁶), and drinking water⁷. Laboratory studies show microfibers - including plastic (e.g., nylon and polyester) and natural (e.g., cotton and rayon) - can cause negative effects to animals⁸⁻¹⁰, and often contain harmful chemicals¹¹, some of which are known toxics¹².

Microfibers are known to shed from textiles, including clothing. Clothes laundering is a major source of microfibers to the environment and washing machine filters are a known solution to the issue.

Many studies show that hundreds of thousands (up to 18 million) microfibers are released during every wash cycle¹³⁻¹⁵. Once released, microfibers travel via wastewater to wastewater treatment plants, where microfibers can be enter into the environment. An estimated 4.8 million tonnes of synthetic microfibers have entered water bodies and terrestrial environments since 1950¹⁶. It is estimated that in California alone, 2.2 kilotons (4.9 million lbs) are generated from apparel washing each year¹⁷. The high land application rate of biosolids leads to large microfiber emissions to land in California¹⁷.

Several technologies are available to reduce microfibers from laundry. Washing machine filters have been studied as a potential mitigation strategy¹⁸⁻¹⁹. Experiments show that washing machine filters are effective at capturing microfibers in laboratory experiments¹⁸ and in field studies²⁰.

Other sources of microfibers include clothes dryers, carpets, upholstery, cigarette butts, and other woven materials (e.g., disposable masks, wet wipes, sanitary products). Currently, the relative contribution from these sources is unknown.

HIGHLIGHTS

- Research shows that washing machine filters capture up to 89% of microfibers¹⁸
- Filters installed in washing machines leads to a significant reduction in microfibers at wastewater treatment plants²⁰.
- Widespread deployment of washing machine filters into homes is an effective solution to prevent microfiber emissions.

Microfibers shed from washing machines captured in a 100 µm filter

A single load of laundry can release 18 million microfibers, which contaminate our:

POLICY RECOMMENDATIONS

- Legislation requiring built-in washing machine filters that capture microfibers in wash water. This could include a microfiber emission cap or a minimum pore size set at a level that is most effective for catching microfibers (e.g., 100 μ m).
- Provide funding for further research on other sources of microfibers (e.g., dryers, upholstery) to the environment.

CURRENT PROGRESS

- France passed 2020-105-Article 79 to require built-in washing machine filters by 2025.
- Several jurisdictions have introduced filter bills (e.g., Ontario Bill 279, UK Bill 205)
- Connecticut Passed HB 5360 (Public Act 18-181) and established a working group to address synthetic microfiber pollution.
- Microfiber shedding test method AATCC TM212-2021, for the textile industry to test microfiber shedding in laundering.

SUMMARY

Whereas, microfibers are ubiquitous pollution in the environment, and

Whereas, there is scientific evidence suggesting microfibers cause harm, and

Whereas, to date, the largest documented source of environmental microfibers is washing machines, and

Whereas, findings indicate washing machine filters divert the majority of microfibers released during laundering and significantly reduce loadings to the environment, therefore,

Scientific evidence supports policy that implement filters, thereby reducing microfiber emissions to the environment.

AB 1628 (McKinnor) would require all new washing machines in California to have a microfiber filter. This is a solution that is cost and energy efficient and has the potential to dramatically reduce the microfibers entering the environment.
